

TraceAssess is an automated vulnerability assessment utility that evaluates your network for security risks and produces easy-to-understand reports for executives and IT professionals.

It combines the power of a vulnerability assessment tool within the convenience of a patch tracking service to ensure proper security posture and verifiable remediation.

TraceAssess helps you prioritize which assets discovers assets within your environment and helps you to assign criticalities. It determines what assets are vulnerable and tracks them through remediation and validation.

TraceSecurity Vulnerability & Compliance Lifecycle

TraceSecurity TraceAssess allows users to easily add new systems.

Key Features of TraceSecurity TraceAssess:

Auto updating so you have the latest updates at any given time

Stop / start capabilities so you can start and finish scans when it's convenient

Secure web-based interface so you can access anywhere anytime

Reporting for executives and IT professionals

False-positive reduction to ensure TraceAssess doesn't alert you to false issues

Flexible testing criteria so you can choose when and how your assets are to be tested

Past remediation report so you can keep track of what has been fixed

Remediation assignment to provide accountability for responsibilities

TraceAssess helps your organization by offering:

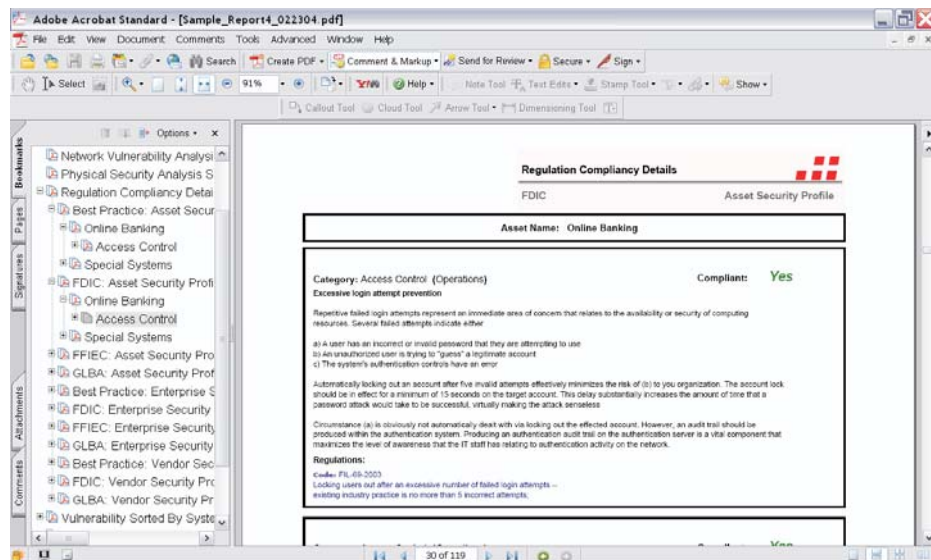

Systems discovery discovering assets in your environment,

Vulnerability database testing your assets using a comprehensive database to ensure no exploits exist,

Patch and vulnerability notification integrating with TraceAlert,

Logical device grouping helping you group your devices in logical order,

Verifiable security posture demonstrating in a repeatable process what assets you have, the criticalities of those assets and those assets that could be vulnerable.

TraceAssess allows you to create PDF reports that help you prioritize what to fix first in your environment.

TraceSecurity TraceAssess gives:

Comprehensive internal and external vulnerability assessment that gives an organization access to all zones of a network environment from a central ASP console at a glance.

On-demand and scheduled capabilities so that organizations can perform security checks when they want to ensure the integrity of the network and proper remediation has been performed.

Scalable solution that offers the ability to assess all businesses from small entities to large institutions. The distributed architecture allows for multiple scanners across a WAN to report back to a central repository.

Intuitive interface that is simple to setup and easy to understand.

Self healing auto update prior to each security assessment. Over 90% of issues can be addressed without customer visit or interaction so that organizations are focused on remediation rather than supporting the product.

False positive reduction so that organizations can focus on security issues that affect the network and only receive notification of the security threats that matter.
